

Patch 27 — Showcase realism + "How it works" section

Base: origin/main @ 44544b8 ("Patch 26: add cushions product photo"). `git apply --check` clean on that base. `tsc --noEmit` clean.

What it does

1. Makes the homepage 3D sofa look real (was: cartoonish/plastic)

- Root cause: the canvas had no environment map. The fabric material (`meshPhysicalMaterial` with sheen) gets zero image-based lighting without one, so it rendered flat.
- `src/components/home/ShowcaseCanvas.tsx` : added a studio environment built from drei `<Lightformer>` s inside `<Environment resolution={256}>` — generated locally at runtime, NO network fetch, NO HDR asset needed. Key strip light + warm/cool side fills + rim light. Ambient dropped 0.55 → 0.22 since the environment now provides the fill.
- `src/components/studio/StudioViewer.tsx` : added a subtle procedural fabric-weave normal map (canvas-generated, 256px, tileable) to the shared `Upholstery` material. This is the micro-surface detail that reads as textile vs plastic. SSR-safe (generated in `useEffect`). Also improves the /3d-studio page sofa, bed, and curtains.

2. New "How it works" section on the homepage

- `src/components/home/ProcessSection.tsx` (new), inserted after WhyMauli, before FAQ: 4 steps — home visit & measurement → fabric & design selection → handcrafted in Pune (Bhosari workshop) → delivered & fitted. All facts already stated on the site (FAQ); nothing invented. Matches WhyMauli's numbered design language.

Apply (PowerShell, repo root)

```
git apply "C:\path\to\27-showcase-realism-and-process-section.patch"
git add -A
git commit -m "Patch 27: 3D showcase realism and How-it-works section"
git push
```

Verify after deploy

- Homepage 3D section: sofa fabric should show soft sheen variation as it turns (not flat matte), with gentle reflections on the arm caps.
- New section visible between "Why Mauli" and "Before you ask." (FAQ): heading "From your home to your home."
- /3d-studio still works (shares the Upholstery material).
